- P-TGs are known to progress in size over time, and can be relatively large at time of diagnosis due to lack of symptoms until significant compression of adjacent structures occur(2).
- The most common symptoms are cough, dyspnea, stridor, dysphagia, and symptoms related to Horner's syndrome and SVC syndrome (4).
- To our knowledge this is the first reported case of a P-TG causing thoracic outlet syndrome.
- Therefore, it would be reasonable to add P-TGs to the list of potential causes of this obstructive condition.
